Excerpt: . . . equation of the vapour, after Callendar, in the form (see Art. 245) $Re c 13--a z---$ p R9 and neglect the last term, since it is small for high temperatures, and 1 Phil. Mwj. , 18S7. 8 Pogg. Ann. Bd. ciii. p. 185, 1858. if we put for v the specific volume v_2 of the saturated vapour, and for a the specific volume i of the liquid (which is probably in most cases a fair approximation), we get R6 Combining this with the thermodynamic equation (5) of Art. 346, viz. we obtain $dp L de 7Re$ Assuming L constant as a first approximation, this equation gives, on integration, , p Ll 1 which is Youngs formula. A closer approximation is got by taking L to be a linear function of the temperature, as in Art. 197, and this leads to Kirchoffs formula. 1 1 The foregoing is from the article Vaporisation, by H. L. Callendar, Eney. Brit. 10th ed. 1902. SECTION IV VAPOUR DENSITIES 213. Definition of Vapour Density. --The density of any substance generally means its weight per unit volume, taken at some standard pressure and temperature. The specific gravity of a substance, on the other hand, is expressed by the ratio of the weight of any volume of the substance to the weight, under given conditions, of an equal volume of some standard substance chosen for the sake of reference. The standard substance usually chosen is water, so that the specific gravity...
